

## Panes – Detachable PDF Preview

This document is rendered entirely in Dart by the `dart_pdf_editor` package (ben-milanko/dart-pdf). No native PDF plugins are involved, so it works inside Flutter's experimental multi-window engine.

How to use this panel:

- \* Drag this tab out of the window to detach it into its own floating macOS window.
- \* Drag the floating window back over the main window to re-dock it, or use the "Snap back" button in its header.
- \* Split it beside another panel by dragging the tab to a group edge.

The PdfReader widget provides search, page navigation, a thumbnail sidebar and view options out of the box – give it bytes and bounded space and it wires everything up.

Page two follows to demonstrate multi-page scrolling and the page thumbnail sidebar.

Each panel in this workspace is an ordinary Flutter widget. The framework does not care what is inside a panel, which is why a full PDF viewer drops in with no special handling.

Detaching is provided by `package:panel_macos` via a thin AppKit / dart:ffi layer: the floating window has its title bar hidden so it looks borderless, and native NSWindow frame tracking powers the drag-back-to-snap behavior.
